

FY24 Audit Expectation to FY25 Evidence Bridge Report

FCRM Risk Assessment — Data Collection, Reconciliation, Data Quality, Lineage, Retention, Timeliness, and Scope Governance

Prepared for internal audit-readiness alignment | June 23, 2026

1. Executive Summary

This report bridges the audit expectations surfaced during the FY24 preparation discussion with the FY25 control documentation already available. The core distinction is important: FY25 documentation should not be positioned as evidence that a FY24 control existed. It should be positioned as (1) current-state control design, (2) evidence of process maturation, and (3) a structured way to answer similar audit questions for the FY25 cycle.

The FY24 expectation set is focused on four audit-facing questions: how data was collected, how logic and queries were determined, how outputs were reconciled and loaded to the RA tool, and how data quality / acceptance was evidenced. FY25 already has a stronger formal evidence package: Data Sourcing & Lineage SOP v2.2, Delivery Process SOP v1.0, FY2025 Data Lineage & Controls Walkthrough, Timeliness Control Spec v0.2, retention and disposition documentation, and an Out-of-Scope / NA / Deferred Items Tracker.

The remaining gap is not mainly technical. It is evidentiary packaging: link each FY25 control to a named artifact, owner, system of record, and sample evidence record; avoid over-disclosure in audit meetings; and separate prior-cycle reconstruction from current-cycle control design.

Topic	Bottom line
Data collection	FY24 evidence is expected in DCTs, SharePoint folders, emails, and the final tool acceptance trail. FY25 formalizes this through source identification, access, extraction, lineage, and delivery SOPs.
Reconciliation	FY24 expectation includes received-vs-loaded counts, template maker-checker, and upload validation. FY25 has explicit validation / reconciliation steps but still needs a clean evidence index for template creation and change management.
Data quality	FY24 expectation includes null checks, date-format checks, 95% availability where applicable, DCT quality notes, and final tool review/challenge acceptance. FY25 has explicit DQ availability table references and lineage-spec-vs-execution checks.
Timeliness	FY24 question may appear as “how do we know the data was current / arrived on time?” FY25 v0.2 correctly treats this as a process control evidenced by Jira readiness, SRZ_TO_ADLS ingestion, and snapshot catalogue creation.
Retention	FY25 has the clearest bridge: CA AZ retention standard, Rahona SRZ/CZ distinction, DRD disposition logic, sample retention check, and last-mile query/test plan.
Out-of-scope governance	FY25 out-of-scope tracker converts unresolved data / requirements / capacity issues into documented scope decisions with reason, sign-off, source evidence, and FY26 carry-forward.

2. FY24 Audit Expectation — What the Auditors Are Likely Testing

Based on the June 23 preparation discussion, the FY24-style audit question is less about whether the team can describe the process verbally and more about whether the team can navigate to evidence without creating new questions. The practical expected evidence shape is below.

Audit area	FY24 expectation / likely question	Expected evidence shape
Roles and responsibilities	Who owned the data pull, query development, unit validation, first-line challenge, second-line	A simple role map; DCT / tool references; acknowledgement that units own the accuracy

	challenge, and final acceptance?	of data they provide while SST/MCC validates fields needed, load completeness, and basic data integrity.
Data collection process	How did the team know what data to collect and from where?	DCTs by unit; SharePoint folder paths; DCT comments; evidence of requirements, data source, logic notes, and approvals where available.
Business-unit provided values	Which values were not query-built by the team?	Explicit carve-out for business-unit-input values: yes/no, counts, values, source notes. Clarify no team query exists where the unit directly provided the data.
Query / logic evidence	Where is the actual query/code or transformation logic?	Databricks notebooks, query folders, extracted code documents where available, lineage folder, DCT logic notes. Avoid claiming a separate code export exists unless found.
Received-vs-loaded reconciliation	How do you know the file received was loaded without loss?	Record counts before / after load, tracker initials/date, load validation evidence if available. If only tracker attestation exists, state that the tracker records completion and initials rather than overclaiming screenshot-level proof.
Template upload controls	How did manual upload templates avoid transposition or wrong-cell errors?	Maker-checker control: template prepared by one person, checked by another against tracker values, dates / initials recorded, uploaded to the tool.
Final acceptance	What is the final evidence that data was accepted?	Final acceptance lives in the RA tool quality assurance / review-and-challenge workflow, not only in interim email approvals. Tool records show SST work, first-line comments, second-line comments, and acceptance.
Data quality checks	How was quality checked?	Null checks, date-format checks, field presence checks, 95% availability / DQ percentage where applicable, DCT quality entries, data quality folder evidence.
Exception / change handling	What happened when second line or reviewers challenged values after sign-off?	Change log / tracker, DCT comments, updated templates, emails, Jira/RAID if used. Interim sign-offs are milestones, not final acceptance.
Evidence disclosure discipline	Can you show me everything?	Provide only the specific artifact requested. Use screenshots and controlled links. Avoid opening broad SharePoint folders live unless necessary.

3. FY25 Evidence Already Available

FY25 artifact	What it proves / supports	How it bridges FY24 expectations
Data_Sourcing_and_Lineage_SOP_v2.2	Defines FY25 source identification, access enablement, data extraction, data understanding, lineage, and retention. It lists Rahona and ADIDO source counts and formalizes CA AZ storage and validation expectations.	Bridge to FY24 data collection and lineage questions. Use as current-state process design, not as FY24 execution evidence.
Delivery_Process_SOP_v1.0	Defines intake through delivery: requirements, data acquisition, logic development, technical specs, output validation, approval, and final delivery. It establishes Jira, GitHub, SharePoint, DCT, AVP approval emails, DEV Query Static Sheet, and Metrics Delivered to IRAT as evidence locations.	Bridge to FY24 process, reconciliation, approvals, and delivery questions. Strongest document for “what is the controlled delivery lifecycle?”
FY2025_Data_Lineage_Controls_Walkthrough_v0.1	Audit-readiness walkthrough from ADIDO/Rahona source to IRAT. Maps completeness, accuracy, data quality, and change control to evidence artifacts. Includes anticipated audit questions and evidence locations.	Directly bridges auditor questions like “show field origin,” “how do you know all records loaded,” and “who signs off?”
Data_Timeliness_Control_Spec_v0.2	Defines timeliness as a process control, not a computed data metric. Evidence bundle: Jira readiness stories/subtasks, SRZ_TO_ADLS ingestion record, snapshot catalogue creation, SOP section, and reviewer sign-off.	Closes FY25 timeliness documentation gap and prevents over-engineering a misleading SQL metric. Useful response if audit asks data freshness / arrival.
Data_Retention_Statement_and_Check_v0.1 /	Clarifies CA AZ vs Rahona CZ/SRZ, PIA-012176	Bridges retention / disposition expectation.

Inventory / Last-Mile / Worked Example	Active + 5 years, DRD disposition within one year after retention exceeded, retention check process, sample record, and last-mile query/test evidence.	Shows documented standard plus sample execution pathway. Note historical check evidence may be forward-looking depending on execution.
FY25_RA_Out_of_Scope_Tracker.xlsx	Records items determined out of scope, not applicable, or deferred with ID, topic, work package, constraint, disposition, reason, sign-off, evidence, carry-forward, status, and notes. Contains early transaction-data examples.	Bridges audit concern that missing data or unclear requirements look like developer failure. Reframes them as documented business / governance decisions.
Meeting notes — July planning and Out-of-Scope tracking	Confirms plan to build out-of-scope register, walk with Andrew/ERA, and write decisions into SOW / scope document and specs.	Supports governance bridge: unresolved FY25 items are managed through formal scope decisioning.

4. Gap Bridge Matrix — FY24 Expectation vs FY25 Control State

# / Area	FY24 expectation	FY25 evidence already available	Bridge action	Residual status
1. Data source identification	Auditor expects DCTs / source documents showing where data came from and what business requested.	Data Sourcing SOP requires Master_Data_source_FY2025_Segment.xlsx, business collaboration, system names, tables, owners, attributes.	Make evidence index: DCT folder, Master Data Source sheet, source-owner references, and SharePoint paths by unit / segment.	Partially closed — evidence exists conceptually; index needed.
2. Unit-provided data carve-outs	Auditor may ask why no query exists for specific values.	FY25 out-of-scope / exception logic plus DCT comments can distinguish hard-data built metrics from business-provided inputs.	Add a standard note in tracker / DCT index: “business-unit provided; no MCC query expected.”	Open — must tag these cases clearly.
3. Query and code lineage	Auditor expects query strings, notebooks, and how code maps to metric.	FY25 SOPs identify Python-SQL in Git, Databricks notebooks, source-to-report mapping, field-level lineage, transform logic documentation.	Build one controlled navigation page mapping metric → DCT → notebook/Git path → QA evidence → approval.	Strong design; evidence package needs assembly.
4. Received-vs-loaded completeness	Auditor may ask for source file count vs loaded/staged count.	FY25 walkthrough names record-count reconciliation, DQ availability table, output validation report.	For each sampled metric/source, capture extract count, CA AZ loaded count, reconciliation result, screenshot/table reference.	Partially closed — needs sample evidence bundle.
5. Data quality checks	Auditor expects null/date/format checks and 95% DQ where applicable.	FY25 lineage and walkthrough reference DQ availability table RA_FY_2025.cde_da_by_lob_segment, validation reports, DCT criteria, missing fields, invalid values, duplicates.	Create evidence catalogue entry for DQ: notebook, table output, threshold result, reviewer, Jira/SharePoint link.	Strong design; sample catalogue needed.
6. Reconciliation and manual template upload	FY24 had manual upload templates and maker-checker initials/date. Auditors may ask how wrong-cell risk was controlled.	FY25 Delivery SOP includes output validation, reconciliation results, final outputs and delivery confirmation.	Add a template-change / upload-control register: template version, created by, checked by, compared to tracker, loaded by, date, reason for change.	Open — this was explicitly identified as missing / weak.
7. Final acceptance and review/challenge	FY24 final acceptance should be in the RA tool, not only interim emails.	FY25 Delivery SOP uses PO APPROVED Jira, BA email, AVP approval folder, and final delivery to IRAT; walkthrough references Business Review in IRAT.	Define “final acceptance evidence hierarchy”: tool/IRAT/Jira state first; email sign-off as supporting evidence only.	Partially closed — terminology alignment needed.
8. Timeliness	Auditor may ask how data arrival/currentness is controlled.	FY25 Timeliness Spec v0.2 treats this as a process gate: Jira readiness, SRZ_TO_ADLS ingestion, snapshot catalogue, reviewer sign-off.	Lock owners, expected refresh definition, and location of arrival-date evidence. Add screenshot procedure.	Partially closed — owner/refresh definition open.
9. Retention and disposition	Auditor may ask retention period, source zones, and how disposal is evidenced.	FY25 retention package references PIA-012176, RRS, Rahona SRZ/CZ policy, DRD procedure, check template, last-mile query, and worked example.	Confirm owner/cadence/SP filing location; execute one sample check and file evidence.	Nearly closed — requires owner/cadence confirmation and sample execution.
10. Out-of-scope / deferred decisions	Auditor may treat missing metrics/data as unresolved gaps unless documented.	FY25 tracker has decision workflow and categories: data unavailable, location unknown, unclear	Complete tracker, obtain Andrew/ERA sign-off, write into SOW/scope doc and specs.	Partially closed — tracker exists but needs sign-off and completion.

		requirement, descope vs FY24, capacity, runway, other.		
11. Evidence disclosure discipline	Audit team can ask broad follow-ups if too much is shown.	Internal strategy is to use screenshots and controlled links; provide only requested artifacts.	Prepare a four-slide controlled navigation pack and a follow-up link list only for artifacts requested.	Process strategy set — execute during meeting.

5. Recommended Audit Positioning

Use the following positioning consistently:

- For FY24 review questions, answer from FY24 evidence first: DCTs, tool review/challenge, SharePoint folders, tracker entries, emails, Databricks notebooks, and any available data quality folders.
- FY25 documents are current-state control design and process maturation. They should be used to explain how similar evidence is now organized, not to retroactively prove FY24 execution.
- Final acceptance should be framed as occurring in the RA tool / IRAT / formal review workflow. Interim email approvals are useful milestones but can be superseded by later review-and-challenge.
- For data provided directly by a business unit, clarify that the unit owns the source pull and source-data accuracy. MCC validates required fields, record loading, format, and downstream calculation where MCC performs the build.
- For manual templates, avoid overclaiming screenshot-level evidence if the evidence is initials/dates in a tracker. State the control precisely: maker-checker comparison against tracker values, then upload.
- For timeliness, use v0.2 language: process control evidenced by ingestion and readiness workflow, not a computed metric that may not represent arrival timing.
- For unresolved or impossible data requests, use the out-of-scope tracker language: documented scope decision, reason, source evidence, sign-off, and FY26 carry-forward.

6. Proposed Four-Slide Internal Prep Structure

Slide	Purpose	Content to include	Evidence to have ready
1. Data Collection Process	Show how requirements and sources were identified and collected.	Roles/responsibilities; DCT folder path; business-unit inputs vs MCC-built queries; source identification flow.	DCTs by unit; SharePoint folder root; source/master data sheet; emails only if requested.
2. Query / Logic / Lineage	Show how metric logic is documented and traceable.	DCT logic notes; Databricks/Git path; source-to-report mapping; field-level lineage; code location.	Notebook/Git link; lineage folder; transform logic document; sample field walkthrough.
3. Reconciliation / Upload / Acceptance	Show how outputs were checked and accepted.	Received-vs-loaded count concept; maker-checker for upload templates; PO/BA/tool acceptance; change management.	Tracker; upload templates; validation/reconciliation result; final tool/IRAT evidence; approval emails.
4. Data Quality / Exceptions	Show quality checks and how gaps are governed.	Null/date/format checks; DQ availability / 95%; final tool QA; timeliness; retention; out-of-scope decisions.	DQ folder; cde_da_by_lob_segment; Jira readiness; retention check; out-of-scope tracker.

7. Immediate Action Plan

Priority	Action	Owner suggestion	Output / evidence	Why it matters
P0	Build an evidence index for Thursday: DCT folders, data quality folder, query/code folder, tracker, upload templates, final tool/IRAT acceptance, and approval emails.	Tom + developers + BA contact	One table with artifact name, purpose, link/path, owner, FY24/FY25 applicability.	Prevents live SharePoint searching and limits audit over-disclosure.
P0	Create a template/upload	Tom + Raul / upload owner	Register with template	Directly addresses the weak

	change-management register for FY24/FY25 uploads.		version, created by, checked by, loaded date, reason for change, evidence link.	area Janine highlighted: manual templates and tracker initials.
P0	Confirm data quality evidence locations by unit.	Andrew / BA team + developers	DQ folder path; DCT quality tabs; null/date/format evidence; 95% output where applicable.	Likely audit question: “how do you know data was accurate / complete?”
P1	Finalize timeliness v0.2 open items.	Richard / Andrew / data readiness owner	Owner of expected refresh, arrival evidence source, Jira structure, screenshot procedure.	Closes EDMO/ORM timeliness commitment as a process control.
P1	Execute / file one retention sample check if not already done.	Retention owner TBD	Completed retention check, screenshot, email confirmation, SharePoint path.	Moves retention from policy statement to executed control evidence.
P1	Complete and sign off Out-of-Scope Tracker.	Tom + developers + Andrew/ERA	Final list, reason categories, source evidence, sign-off, SOW/spec update.	Converts missing/unclear data into governed scope decisions.
P2	Align wording for “approval,” “acceptance,” and “validation.”	Richard + Tom	Glossary / evidence hierarchy in prep pack.	Avoids confusing interim approval with final tool acceptance.

8. Risk Register — What Could Still Be Challenged

Risk	Challenge	Mitigation
Retrospective evidence risk	Audit may ask whether FY25 SOPs existed during FY24 execution.	Do not present FY25 SOPs as FY24 evidence. Use FY24 DCT/tool/emails/tracker first; use FY25 SOPs as current-state bridge and remediation.
Evidence completeness risk	Some FY24 DCTs may lack LOB approvals or final email attachments.	Point to final tool acceptance as the final review/challenge record; treat emails as interim support only.
Manual process risk	FY24 uploads were manual and no automation existed.	State maker-checker control precisely; provide tracker initials/dates and template validation evidence; do not overclaim automation.
Data-owner accountability risk	Auditors may expect MCC to validate unit source SQL.	Clarify accountability split: unit owns source pull accuracy; MCC validates received fields, load completeness, format/integrity, and MCC-built outputs.
Over-disclosure risk	Showing broad folders live may expose unrelated gaps or draft documents.	Use screenshots and controlled artifact list. Provide links only for requested evidence after the meeting.
Out-of-scope ambiguity risk	Unclear or unavailable transaction data may be interpreted as a delivery failure.	Use signed out-of-scope register with reason, business/gov action, source evidence, and FY26 opportunity.

9. Evidence Catalogue Starter

Evidence category	FY24 evidence to locate	FY25 evidence already available	Use in audit response
DCT / requirements	Unit DCTs, comments, requirements, business input values	Delivery SOP; Data Sourcing SOP; Master Data Source sheet references	Primary source for data collection and requirements.
Code / query logic	Databricks notebooks; query folders; extracted code docs where available	GitHub / notebooks / transform logic documentation / lineage walkthrough	Show logic only for MCC-built metrics.
Data quality	DQ folders; null/date checks; 95% records; DCT DQ entries	DQ availability table; validation reports; DCT criteria; lineage QA rule	Show specific checks for sampled items.
Reconciliation	Received-vs-loaded counts; tracker validations; output validation	Output validation report; reconciliation results; DEV Query Static Sheet	Support completeness and output accuracy.
Approval / acceptance	Tool QA tab; first-line / second-line comments; BA emails; approval emails	Jira PO APPROVED; PO concurrence; AVP approval; final IRAT delivery	Use tool/Jira as final acceptance, emails as supporting.
Timeliness	Any FY24 ingestion / readiness records if asked	Timeliness Spec v0.2; Jira readiness; SRZ_TO_ADLS; snapshot	Use process-control framing.

		catalogue	
Retention	FY24 applicable retention standards, if in scope	Retention statement, inventory wording, last-mile query/test, worked example	Use as FY25 control design and sample evidence.
Scope decisions	DCT comments, emails, decision logs	Out-of-scope tracker; meeting minutes; SOW/spec update plan	Use to prevent unresolved items being treated as developer gaps.

10. Closing Recommendation

For Thursday, the team should not try to present a polished “new process.” The safer posture is a controlled evidence-navigation pack: four slides, each tied to exact folders, exact artifacts, and exact owners. The team should answer only the question asked, provide screenshots or artifact references first, and send links afterward only for artifacts requested. The strongest bridge is to say: FY24 evidence is reconstructed from FY24 artifacts and final tool acceptance; FY25 formalizes the same control themes into a repeatable audit-ready framework with stronger lineage, quality, timeliness, retention, and out-of-scope governance.
